Description			
Imagine the following scenario:			
<ul style="list-style-type: none">• existing page record with an IRRE field (use irre_tutorial to reproduce, there's also a test case for this)• one child record is existing in live workspace• add new child records in custom workspace• publish them			
The result is, that the sorting order of those child records is wrong, since sorting is applied in <code>t3lib_loadBDgroup->writeForeignField()</code> which gets called when not all records have been processed. The solution is to recall <code>writeForeignField()</code> with a <code>remapAction</code> after all database operations.
