Target version:	1.0 beta 1	Complexity:	
PHP Version:			
Has patch:			

Description

This might be me, misunderstanding the queryResult return of a findAll function from \F3\FLOW3\Security\AccountRepository but here goes:

Debugging the output of `$this->accountRepository->findAll()` (using `\F3\var_dump`) i get the following dump

```
F3\FLOW3\Persistence\QueryResult [prototype]
  dataMapper => F3\FLOW3\Persistence\DataMapper [singleton][filtered]
  persistenceManager => F3\FLOW3\Persistence\PersistenceManager [singleton][filtered]
  query => F3\FLOW3\Persistence\Query [prototype][filtered]
  queryResult => NULL
```

from what I see, my queryResult (the resulting objects?) is empty. But adding the `"->toArray()"` function (or parsing it through `<f:for ..><f:debug..` in fluid) I get my expected objects.

So, from my view, it looks like resulting objects isn't attached to the queryResult property?

If you `var_dump()` it, the QueryResult is not initialized. If you use `toArray()` or iterate over the QueryResult, things will work as expected.
