Description

In the Web>Page, Columns view, each tt_content element of type "list" (plugins) are displayed with the text:

Extension: <plugin name>

CODE: <select_key field content>

The select_key is not being used anymore by the majority of extensions, which now usually opt to use pi_flexform for storing setup configuration. So it would be nice to be able to display some other information instead of "CODE:".

The proposed hook provides enough flexibility so that extensions can display whatever they want on that place for their plugins (some setup from flexform, maybe even a list of records which will be displayed, or whatever else might be interesting in this overview).
