Description			
<p>Hi Stan,</p> <p>I detected a weird bug in FF3:</p> <p>Problem:</p> <p>Create a class for ul with the property list-style-position: inside. Create some li-elements and highlight the very first string of an li. Result: The inline buttons remain disabled.</p> <p>Now type a space before the first word and highlight it again (without the space). The inline buttons become active.</p> <p>It is not that I think you can do anything about it (or can you), seems to be an FF thingy as I cannot reproduce this behaviour in Opera 9.63 and not in IE6.</p> <p>Kind regards, Uschi</p> <p>(issue imported from #M11298)</p>

Hi Uschi,

My apologies for taking so long to reply to this issue.

I just tried to reproduce this issue with current trunk (revision 7843) and with Firefox 3.6.3. With no success.

If you start the selection before the first bullet, then the inline elements are disabled, but the status bar tells you that you are in fact selecting the whole ul. That is the only way I could reproduce a behaviour similar to your description.

Kind regards,
Stan
