Description			
Hello guys,			
using 4.5 since trunk now i do have a suggestion how to speed up module loading in backend rapidly ;) (It's still fast - but can be even more faster)			
Step 1: Use an ExtJS CardLayout for the right Module Frame.			
Step 2: Old modules get an iframe (eventually only one) in that CardLayout(Like Tabs but without userselectable card - needs to be selected via activeCard setting). New Modules get an ExtPanel.			
Step 3: Event about changed env: - module activated - module deactivated - pageselected - ...			
Using that the new modules like extmgm, trash, EXT:ks_sitemgr and others get the change to transfer only changed parts (grid stores, etc.) and thus it makes UI faster.			
What do you think about that?			
Regards Kay
