Description

I just upgraded an environment from 4.4.6 to 4.5.0. When trying to update the workspaces in the install-tool, I get an error:

```
Fatal error: Call to a member function includeLLFile() on a non-object in  
[.....]/typo3_src-4.5.0/typo3/sysext/em/classes/install/class.tx_em_install.php on line 72
```

(issue imported from #M17688)

This happens when you have register globals enabled in PHP. The environment variable 'LANG' will be used in the \$GLOBALS array. This is not an object and thus calling \$GLOBALS['LANG']->includeLLFile() will of course fail.

TYPO3 requires register globals to be disabled. The Reports module shows you an error message when it is enabled.
