PHP Version:			
Has patch:			

Description

After introducing the Utility\TypeHandling functions, an InvalidArgumentException is thrown if some @var annotation uses a wrong type (and certainly also if invalid types are used elsewhere). However, the exception doesn't (and can't) give any hint where the invalid type was declared.

We have two options to improve this:

- 1) let the TypeHandling functions return FALSE if the type could not be parsed and throw a proper exception in the calling method
- 2) let the calling method catch the TypeHandling exceptions and rethrow a better exception

I'm all for solution 1)

[BUGFIX] Type declaration errors give hint on root cause

The TypeHandling::parseType() function will now throw a more specific exception which allows other code parts to display more meaningful error messages if a variable type was declared wrongly.

Yes, as I have the same problem here currently: Please go for solution 1! -> I will include that in my serialization changes...

#2 - 2011-08-04 08:24 - Sebastian Kurfuerst

- Target version changed from 1.0 beta 1 to 1.0 beta 2

we won't manage this for beta1 anymore, postponing
