Description			
The php backend in rsaauth checks if it would work correctly by testing if key generation would work. But this is only checked on Windows platforms. Since there also could be nix platforms with a wrong OpenSSL configuration, we should remove this limitation and check in any case.

[BUGFIX] Check if OpenSSL works on every platform

The php backend in rsaauth checks if key generation works on Windows platforms.
Since there also could be *nix platforms with a wrong OpenSSL configuration,
we should remove this limitation and check if key generation works in any case.

Could you please have a look at [#33165](#) - it looks like the calls to `isAvailable()` during every request isn't very economic..
