**Description**

As ViewHelpers are supposed to be stateless they were create once per RenderingContext and reused whenever the RenderingContext fits. Some ViewHelpers are not stateless, e.g. AJAX widgets.

AJAX widgets push their WidgetContext into an AjaxWidgetContextHolder before they get rendered.

As soon as AJAX-WidgetViewHelpers were used multiple times within the same RenderingContext (widgets in ForViewHelpers for example) differet widgets share the same ViewHelper containing the same WidgetContext. Because the WidgetContext contains all statefull information about a widget, only the last rendered widget gets stored in the ContextHolder. That makes equal AJAX widgets within a for-loop impossible because each GUI representation interacts with only the last rendered PHP object.

[FEATURE] Widgets: Reset WidgetViewHelpers when being reused from ViewHelperNode

- Introduce an AbstractViewHelper::resetState method to handle any kind of statefull interaction, empty by default.
- Make ViewHelperNode call resetState when reusing a ViewHelper, and also call it when reusing it in a compiled template.
- AbstractWidgetViewHelper implements resetState for creating a new WidgetContext object.

As ViewHelpers are supposed to be stateless they were create once per RenderingContext and reused whenever the RenderingContext fits. Some ViewHelpers are not stateless, e.g. AJAX widgets.
