[BUGFIX] Fix content security current.globalObject expansion

Using for example current.securityContext in Policy.yaml made FLOW3 crash completely in "eval'd" code.

This fixes the crash and removes the eval code by using the TYPO3\FLOW3\Object\ObjectManager.

Moving over the test discussion here:

We already have functional tests for persistence with entities and repositories in the TYPO3\FLOW3\Tests\Functional\Persistence\Fixtures namespace. Also the Configuration in TYPO3.FLOW3/Configuration/Testing/Policy.yaml could be used for testing (with some comment about the usage).

I think a functional test for content security would best go into a new testcase TYPO3\FLOW3\Tests\Functional\Security\ContentSecurityTest. Take a look at the MethodSecurityTest for a hint about how to authorize different roles in a functional test.

To run a functional test you have to use the FunctionalTests.xml PHPUnit configuration in Build/Common/PhpUnit. For example in the FLOW3 package directory you can call `phpunit -c ../../Build/Common/PhpUnit/FunctionalTests.xml Tests/Functional` to run the functional tests.

The test should first cause the error (without your change) and then pass after your fix.
