Has patch: No	

Description

In some cases, `get_class($object)` returns the Doctrine proxy class; and not the actual, intended class name.

In Doctrine itself, there is a method `Doctrine\Common\Util\ClassUtils...`

```
/**
 * Get the real class name of an object (even if its a proxy)
 *
 * @param object
 * @return string
 */
public static function getClass($object)
```

which basically does some `str_replace`; unfortunately it doesn't work with FLOW3 proxies due to a different naming scheme.

A possibility is to provide a method that

```
if ($object instanceof \Doctrine\ORM\Proxy\Proxy) {
    return get_parent_class($object);
}
```

but that's probably not very clean.

So, a reliable method to achieve that should be provided by FLOW3.
