Has patch:	No		

Description

Testing code which uses dependency injection requires some additional lines of code for manually injecting the dependencies needed to run a unit test. This can become cumbersome in case of property injection, as reflection needs to be used in order to set a protected property.

An inject() method provided by the Base Test Case would make things a lot easier.

[FEATURE] inject() convenience method in Base Test Case

Testing code which uses dependency injection requires some additional lines of code for manually injecting the dependencies needed to run a unit test.

This patch provides a new convenience method – inject() – which takes care of manual injection of dependencies in unit test cases.

Resolves: #35135

Releases: 1.1
