#### Description

When a reverse proxy is configured in \$TYPO3\_CONF\_VARS and you call t3lib\_div::getIndpEnv('TYPO3\_SSL') it returns the wrong protocol.

You can reproduce this in the following way:

If realUrl has the configuration to take the next higher level in the page tree in the case of not finding the current page then the protocol will be changed by the static method t3lib\_div::getIndpEnv('TYPO3\_SSL')

Example:

<http://url-zur-seite/die-es> nicht-gibt

results

<https://url-zur-seite>
