**Description**

I developed a new widget which might be interesting to move it to the core. It's an universal progress bar calling a controller action by ajax to load progress.

You can easily use it in your own fluid templates by just adding

```
<f:widget.progressbar id="progressbar" action="ajax" message="1" messageText="This text is shown below the progress bar" arguments="{itemsToLoad: 10}" controller="yourController" package="yourPackage" subpackage="yourSubpackage" />
```

For explanation:

- id means the id of the div container the progress bar is insert into
- action is the action to be called from the ajax request
- message indicates if a message under the progress bar should be displayed
- messageText is the default text to show (under the progress bar)
- arguments is an array of arguments passed to the action request
- controller defines the controller the action belongs to, if not set the current one is used
- package and subpackage define the package the controller belongs to, if not set the current ones are used

The actions has to return an json string having to keys:

- value has to be an integer representing the status in percent (with the percent sign)
- messageText is the string added to the message container below the progress bar (if enabled)

If you have any questions just ask me :-)
