### Description

Packages should not be freezable in Production - and probably they are behaving correctly already. However, when flushing the caches for example in Production context, a list of frozen packages will be displayed.

Investigate if this is only a display issue in that command or if packages are truly handled as frozen in Production (which would be wrong). cache:flush in Production should flush all caches.

## Associated revisions

### Revision 4bff5587 - 2012-06-05 10:45 - Karsten Dambekalns

[BUGFIX] Packages can be frozen in Development only

Freezing packages was not possible in other contexts than Development with the related commands. But if a package was frozen according to PackageStates.php, it would advertise itself as frozen in all contexts.

While this did not seem to have any real effects, it caused confusing output with the cache:flush command in Production context.

This change makes the Package class ignore the frozen state in any context except Development and adds a check in the freezePackage() method of the PackageManager.
