

TYPO3 Core - Feature #37412

Epic # 55575 (Closed): Streamline JavaScript Code in the TYPO3 Backend

Move all JavaScript Frameworks to separate extensions

2012-05-23 08:55 - Kay Strobach

Description

This would make it possible to see, which extensions depend on which framework, and they could appear in the credits / about page.

Some functions need to be adjusted (e.g. in pagerenderer loadExtJS ...)

JS Framework should be registered in a Framework registry (either as file, or with a class, which "calculates" the files needed, and though could be loaded with a call like:

```
$pageRender->loadFramework('name', $optionsArray);
```

So currently we would have the following extensions:

- jQuery
- extjs
- prototypeScriptaculous
- ...
