Description

also appears in 4.5 and very likely 4.6

If the stdWrap functionality of HMENU.special.value is used, this is applied twice.

I'm not very familiar on how HMENU works internally. If someone could tell me the best place to fix this without side-effects, I would be happy to submit a patch.

Here are my findings:

The first time stdWrap is applied is tslib_content_HierarchicalMenu::render() (line 59 in TYPO3 4.5.19). Then it is added multiple times across tslib_menu again.

I would go with removing the stdWrapping in tslib_menu, but am I right with this or is there any other entry point to this class other than tslib_content_HierarchicalMenu::render() that I should check?

[BUGFIX] stdWrap for special.value applied twice

In HMENU the stdWrap for special.value is applied twice. This patch removes the superfluous call in HierarchicalMenuContentObject.php.

Furthermore it also moves the stdWrap for excludeUidList to AbstractMenuContentObject.php for consistency reasons.

Hi!

Looking at the whole code here, all I can say: This is a complete mess!

After thinking about it a lot, it is somewhat impossible to move all the stdWraps of HMENU to the place where they actually belong, namely tslib_content_HierarchicalMenu.

One major problem is the fallback mechanism of minItems and maxItems.

Hence, the only chance to get this fixed is to remove the stdWrap from tslib_content_HierarchicalMenu.

Also excludeUidList should be moved to the place where it is used, to get at least some kind of consistency.

The stdWraps in tslib_menu are there since Nov. 2007 by Bernhard Kraft, whereas tslib_content_HierarchicalMenu exists only since Oct. 2010.
