Has patch:	No		

Description

I tried to create a blog following The Definitive Guide.

I ran into the "problem" that I did not get the exception described on <http://flow3.typo3.org/documentation/guide/partii/validation.html#validating-updated-arguments>.

As I Tried updating a post with an empty title and submitting the form I got back to the editAction, seeing the form having an empty title-field.

In addition I saw the error-info "title: This property is required."

So I did not have to add the annotation "@FLOW3\IgnoreValidation("\$post)").

Before I added the annotations "@FLOW3\Validate(type="NotEmpty")" to the model, I saved a post having an empty title and I was not able to open this post in the edit-view.

Here's the source of the controller and the model: <https://gist.github.com/3819948>

- Status changed from New to Needs Feedback

I think the behavior we implement currently is correct; it's just that the guide is incorrect at this point.

Hi, Sebastian

I don't know what is the correct way ... just that this is incompatible.

For me, too, it feels more natural to change the docs. Opening an edit-view having an invalid dataset should result in an error (unleasat you have the ignoreValidation annotation) but getting back when the framework rejects a request, should be possible.

Facing this, there is a case, you covered now, that wouldn't be coverable if you'd have implemented it the way the documentation says.
