

TYPO3.Flow - Feature #4166

Allow disabling validation for action arguments

2009-08-06 11:01 - Robert Lemke

Status:	Resolved	Start date:	2009-08-06
Priority:	Must have	Due date:	
Assignee:	Robert Lemke	% Done:	100%

Target version:	1.0 alpha 3	Complexity:	
PHP Version:			
Has patch:			
Description			
In situations where a knowingly incomplete / invalid argument needs to be passed to an action, for example an edit action, it is necessary to disable validation for a single or multiple arguments. This should be possible by calling a <code>disableValidation()</code> method on the argument object or by adding a <code>@dontvalidate \$argumentName</code> annotation to an action method.			

Associated revisions

Revision 10ec9ad8 - 2009-08-06 11:40 - Robert Lemke

[+FEATURE] FLOW3 (MVC): It is now possible to disable validation temporarily for single controller arguments. This is necessary in situations where a knowingly incomplete / invalid argument needs to be passed to an action, for example an edit action. Validation can be disabled either by calling the `disableValidation()` method on the argument object or by adding a `@dontvalidate $argumentName` annotation to an action method. Resolves #4166

[+TASK] FLOW3 (Documentation): Documented the new `@dontvalidate` annotation.

[+FEATURE] FLOW3 (Package): The package manager's command line controller now returns a friendly error message on trying to activate or deactivate an already active or inactive package. Earlier it just threw an unpolished exception.

[+FEATURE] FLOW3 (Persistence): Implemented an `update()` method for the base repository which allows for conveniently updating existing objects. `update()` only expects one argument which must be a clone of the object to replace, already containing the modifications. The object passed to `update()` must internally contain the same uuid like the object to be updated (ie. replaced). In fact this new `update()` method is basically a more convenient way to call `replace()`. Resolves #4167

[+BUGFIX] FLOW3 (MVC): A `@validate` annotation placed in an action method's comment replaced existing rules instead of adding them to a common conjunction validator. By this it was possible to override any validation rule with a simple `@validate $foo Raw` annotation. Fixes #4168

History

#1 - 2009-08-06 11:02 - Robert Lemke

Technical background: the flag "validationDisabled" is recognized by the ArgumentsValidator: if it is set, the given argument is not included in the property validation and thus ignored.

#2 - 2009-08-06 12:00 - Robert Lemke
