

FE User Management - Feature #42032

add support for value instead of uid in select fields

2012-10-16 08:34 - Peter Kraume

Description

Recently I've switched an existing TYPO3 installation from sr_feuser_register to datamints_feuser.

sr_feuser_register uses the fe_users fields "static_info_country" and "language" to store cn_iso_3 from static_countries and lg_iso_2 from static_languages to the fe_users table.

When trying to rebuild this "feature" with datamints_feuser I stumbled over the problem that datamints_feuser stores only the uid of the foreign table (which is not bad, but not suitable for my problem). There is a feature called copyfields which can help to write the correct value to the database (see FAQ in documentation: How can I add a country drop down?). But it is still not possible to highlight the chosen value in the dropdown list when a user edits his data.

So I decided to extend datamints_feuser a little bit to add this feature (see attached patch). I've added "tablevaluefield" to the typoscript configuration.

```
plugin.tx_datamintsfeuser_pil {
    fieldconfig {
        static_info_country {
            config {
                type = select
                items {
                    0 {
                        0 = --- Bitte auswählen ---
                        1 =
                    }
                }
                foreign_table = static_countries
                foreign_table_where = AND static_countries.pid=0 AND static_countries.cn_short_de
!= '' ORDER BY static_countries.cn_short_de
                size = 1
                minitems = 0
                maxitems = 1
            }
        }

        language {
            config {
                type = select
                items {
                    0 {
                        0 = --- Bitte auswählen ---
                        1 =
                    }
                }
                foreign_table = static_languages
                foreign_table_where = AND static_languages.pid=0 AND static_languages.lg_name_de !=
= '' ORDER BY static_languages.lg_name_de
                size = 1
                minitems = 0
                maxitems = 1
            }
        }
    }

    tablelabelfield {
```

```
    static_countries = cn_short_de
    static_languages = lg_name_de
  }

  tablevaluefield {
    static_countries = cn_iso_3
    static_languages = lg_iso_2
  }
}
```

This feature currently works only for select fields with one value. Multiple values are not supported.

I hope you get my point and this patch will make it into a future version of datamints_feuser.

- Status changed from New to Under Review

- Assignee set to Bernhard Baumgartl, datamints GmbH

Hi,

this looks quite nice. Have you tested it with the validation Methods (checkRequired, ...) and JS validation?

If this completely works i will implement it.

Best regards
Bernhard Baumgartl

#2 - 2012-10-16 10:22 - Peter Kraume

I haven't tested validation so far. But I will do so and provide some feedback.

#3 - 2014-01-14 18:24 - Marc Neuhaus

+1 for this feature :)
