Description

I think there is a strange bug in the content security

Initial situation:

3 Models

- Product

-- Category

--- Tutorial

The Product Model includes the categories and the categories the tutorials

With FLUID i can do something like that (3 nested for-loops)

```
<f:for each="{products}" as="product">
  <f:for each="{product.categories}" as="category">
    <f:for each="{category.tutorials}" as="tutorial">
      {tutorial.title} (Disabled: {tutorial.disabled})
    </f:for>
  </f:for>
</f:for>
```

The Tutorial Model has a disabled class var which includes a boolean.

My Policy.yaml has the following content

```
resources:
  entities:
    Kj187_Tutorials_Domain_Model_Tutorial:
      Kj187_Tutorials_Domain_Model_Tutorial_Disabled: 'this.disabled == TRUE'
```

The problem is, it doesnt work with 3 (or more) nested loops. I get all tutorials, all with 'disabled equals 1' and all with 'disabled equals 0'.

If i get only the categories via repository and do something like that

```
<f:for each="{categories}" as="category">
  <f:for each="{category.tutorials}" as="tutorial">
    {tutorial.title} (Disabled: {tutorial.disabled})
  </f:for>
</f:for>
```

it works!

Another problem is that i can call a tutorial with 'disabled = 1' directly (<http://local.domain/PRODUCT/CATEGORY/TUTORIAL.html>) without any problems ?!

History

Wrong issue infos!

It doesnt work also with only 1 nested loop!
