Description

I am just testing the ext and there is a problem with wording if a user forgets to set an interval.

error message: "Please insert a valid interval (> 0)"

but the label of the field is "Frequency (seconds or cron command)" > the word 'interval' is never mentioned, so IMO it would be the best to change the label to "Interval (seconds or cron command)" or the error msg.

Revision 1203 - 2009-09-07 20:52 - Francois Suter

Improved wording of error message for invalid frequency, resolves #4474

History

#1 - 2009-09-07 20:45 - Francois Suter

- Status changed from New to Accepted

- Assignee set to Francois Suter

Just to explain the history of that difference: Gabriel actually has 2 different fields, plus a selector to choose between the type of input for the frequency (interval or cron command). I made all that transparent to the user, but still kept tests where I tried to guess which type of input was given and produce differentiated error messages.

But I agree that this may not help so much and will propose a different wording.

#2 - 2009-09-07 20:54 - Francois Suter

- Status changed from Accepted to Resolved

- % Done changed from 0 to 100

Here's what I changed: I merged the invalid interval and invalid cron in a single message, which says: "Invalid frequency. Please enter either a number of seconds or a valid cron command." I hope this is fine.
