Target version:	Complexity:
PHP Version:	
Has patch: No	

Description

if you have valueObjects and want to show them in an action controller with `showAction($myValueObject)` and get param comes in with `&myObject[__identity]=123123-123123-231231` the converting fails because `__identity` will allways be unset and no other property left after this. i solved this by simply adding 3 lines in the `convertFrom` method:

```
// if there is just only the identity we convert the source to string
if (is_array($source) && count($source) === 1 && array_key_exists('__identity', $source)) {
    $source = $source['__identity'];
}
```

see also attached extended class with higher priority

do you agree with it?
thank you
carsten
