Category:	Content Rendering	Estimated time:	0.00 hour
Target version:	1.0 beta 1	Spent time:	0.00 hour
Description			
<p>Currently, we always use f:format.raw ViewHelper inside all Content Element templates... The problem with that is that it's very unsafe, disabling the complete security which was in-built.</p> <p>Enabling it in all cases is not nice as well, as we need to control that on a case-by-case basis.</p> <p>That's why we want to introduce a SafeString class, which is directly rendered without any escaping; while in the default case, the escaping should stay active.</p>
