

Dynamic Content Elements (DCE) - Feature #49452

Add basic file abstraction layer configuration

2013-06-26 19:16 - Oliver Hader

Description			
see https://github.com/ohader/dce/commit/2fd09b8221a6d85b56a065b9e68e61528aec9cc1			
The code template contains something like "dce{dce.uid}" which is Fluid notation but not parsed as Fluid in that regard. For references it is required to be specific about the parent side, especially if Flexforms are used - this way the uid of the DCE field element is referenced. It's not required to be an integer, but it needs to be unique (e.g. on adding a new DCE field, the NEW placeholder might show up there).

I have added your configuration sample, but not the replacement of {dce.uid}. Creators of DCEs should fill this field manually in each dce field using FAL.

The value must just be unique in each dce. In serveral dces you may use the same fieldname again.
