Description			
Hello Core-Team,			
with your new implementation of cache_classes you have crashed extbase. If form has Errors (Validators) extbase calls the errorAction. When calling:			
<code>\$referringRequest->getControllerActionName();</code>			
I get following error in FE:			
Fatal error: Cannot redeclare class TYPO3\Sfvalidator\Controller\PersonController in /Applications/MAMP/htdocs/typo3_git/typo3conf/ext/sfvalidator/Classes/Controller/PersonController.php on line 107			
If I debug within getControllerActionName the name was resolved correctly. But when I debug getControllerActionName in Request-Object then I get the error with redeclaration. There seems to be some magic I don't understand. Maybe it is because of "new" in getReferringRequest()?! Stefan

Revision 25608d6b - 2013-10-15 12:38 - Thomas Maroschik

[BUGFIX] Preserve vendor name in referring request

Fluid FormViewHelper adds some hidden fields that contain information about the current controller. When the form is submitted and contains a validation error the errorAction in the ActionController is hit. This one builds a referring request object from the hidden fields without a vendor name, as this one is not passed from the FormViewHelper. The request object tries to guess the controller name but guesses a non namespaced classes name as the vendor name is not given. To get further information about the class methods the class name gets autoloader and creates a wrong classes cache entry as the autoloader cannot detect if an extension has namespaced or non namespaced classes from the outside.

This patch introduces a hidden vendor name field in the Fluid FormViewHelper.

Fixes: #52823

Releases: 6.2, 6.1, 6.0
