Description			
If you try to update a current 6.1 introduction package without any other core update the database scheme updater fails and blocks other updates.

[BUGFIX] Improve database scheme updater

This patch improves the update process as it removes the hard stop after an SQL error occurred. All queries should get executed and errors should be reported at the end. Sometimes it gets necessary that the updater is called more than once - a notice to the user is added.

Besides the index length is reduced by 1 to ensure the index is set with limitation in the database and all fields can be updated in the second step.

Resolves: #57421

Releases: 6.2

To be more clear according to the identifier key issue:

in a current 6.1 installation of the introduction package the field length of identifier is 200. Within the update of the key "identifier" the length is set to 200 chars as well. This used to be okay, as within some 6.1 update the table field was raised to a length of 512 chars. Then the database index gets correctly cropped to 200 chars.

But coming from an older not uptodate 6.1 installation the key is only set to the field without any cropping. This causes a problem for the field update to 512 chars as the index becomes too big. To solve this issue manual handling in the compare database wizard or even the database itself is needed.
