[BUGFIX] Flaws in copying a page with localized content elements

Copying a page with localized content elements in a workspace has some flaws. In a workspace a duplicated record will end up in a new-placeholder and the specific version record.

The translation pointer field of the new-placeholder still contains the unmodified value of the original record, the specific version record is fine however.

The reason for that is the special handling for cloning a page in DataHandler. Each record of a particular table is copied in reverse order. This way, the localization is created earlier than the record of the default language.

This change is about skipping the direct copyRecord() call for

records that will be processed inside another copyRecord() call for the record of the default language.

- File copy-of-page-in-ws.png added

Here is what I do:

In Live WS:

1. Create a new Page
2. Create a translation of that page
3. Create a Content Element on that page
4. Create a translation of that Content Element
(See Screenshot "source-page-from-live-ws")

In WS:

1. Copy that page
2. Insert after that page
3. View the new pasted page in page module
(see Screenshot "copy-of-page-in-ws")

Issues:

1. The translated Content Element was created twice
2. The Button for translate default content is shown nevertheless

Expectation:

1. Only one translated Content Element
2. No "translate default" button

Thanks for your analysis and documentation of your findings.

Unfortunately, I could not reproduce the duplication issue of the content records - the database view on tt_content seems to be fine as well. The issue with the button is reproducible however, but needs to be solved differently for the viewing component in the page module (it's a misinterpretation of the record data).

```
mysql> select uid,pid,sys_language_uid,l18n_parent,header,t3ver_oid,t3ver_state,t3ver_wsid from tt_content order by uid DESC limit 16;
```

uid	pid	sys_language_uid	l18n_parent	header	t3ver_oid	t3ver_state	t3ver_wsid
291	-1	1	288	[Translate to German:] Content	290		
290	56	1	288	[Translate to German:] Content	0		
289	-1	0	0	Content	288		
288	56	0	0	Content	0		
287	-1	1	284	[Translate to German:] Content	286		
286	54	1	284	[Translate to German:] Content	0		
285	-1	0	0	Content	284		
284	54	0	0	Content	0		
283	53	1	282	[Translate to German:] Content	0		
282	53	0	0	Content	0

I guess that [#68395](#) might be a relevant candidate for the button thingy...

#9 - 2015-08-23 12:05 - Daniel Goerz

Did you really apply the patch? I get your results **without** the patch. No matter what, **with** the patch I get two translated CEs. maybe someone else can test this as well.

#10 - 2015-08-23 12:31 - Daniel Goerz

OK, I did more tests. Created new PageTrees with two or more languages and wasn't able to reproduce the double creation either. however in the first PageTree I cant make the double creation disappear but I wont blame the pacht any longer and remove my -1. I will investigate further and let you know If I find a way to reproduce the double creation issue.
