Description			
Flushing a whole workspace in the workspace, which contains record localizations, shows warnings like this in the workspace module: Attempt to reset workspace for record failed: No record			
The reason for that is simple, the record already has been flushed since it's a localization.			
Thus, either the warning can be omitted by tracking already processed elements or record localizations need to be processed before the default record.

Revision 417e5a56 - 2020-07-29 09:55 - Christian Kuhn

[BUGFIX] Add more log info when discarding workspace records fails

Discarding records in the workspace module may lead to 'You do not have edit access' log entries. The issue is hard to reproduce without the table name and uid in the log. The patch changes the log entry to contain this info. This is similar to the log entry change for issue #61719.

Revision ba5c16aa - 2020-07-29 12:02 - Christian Kuhn

[BUGFIX] No bogus log entries when discarding workspace records

Selecting a page and records on the page to be discarded in the workspace module can lead to log entries that records could not be deleted.
This can happen when discarding (deleting) a page that only exists in the workspace already has deleted records on the page. The explicit call to delete single records then creates this log.
The solution is to ask the DataHandler if the record in question has already been deleted to avoid deletion in this case.
Additionally, the log entry now contains the table:uid to make it more useful in case it pops up again.

In master / v11, there are no warnings in the workspace module itself, only db logs. However, the issue itself is still reproducible and does not even need record translations:

- Have a workspace set up on page 0
- Switch to this workspace
- Create a new page in this workspace
- Add a content element on this page
- Go to workspace module, select 'all' button or select both the page and the record
- Second drop-down "Choose selection action" -> Discard (page and content element are thrown away)

-> This creates one log entry in the log table:

- System -> Log module, filter action "Database" -> See "Attempt to reset workspace for record failed: No record"

Reason: Sending action 'clearWSID' (to throw away ws records) sends both the page and the content element. The page record is deleted first, which deletes the content element as well. The call to delete the content element then creates the log entry.

Note this not only happens if deleting a page that has a content element (or other record), but also if having a page with a sub page and discarding both through the workspace module.
