Description			
<p>I reported this bug there: http://bugs.typo3.org/view.php?id=13810 earlier and was told to put it here, so here it comes:</p> <p>in typo3/sysex/typo3/Classes/View/TemplateView.php on line 358 the method parseTemplate() should return a helpful error message in case the file cannot be read.</p> <p>I had forgotten to give the server read access to my template file and the only thing i got over and over was</p> <p><code>Tx_Fluid_Core_Parser_Exception</code> Parse requires a template string as argument, boolean given.</p> <p>from the typo3/sysex/typo3/Classes/Core/Parser/TemplateParser.php on line 271.</p> <p>I mean if you know that <code>file_get_contents</code> returns false if there is an error, it's simple to look for the error, but even that involves looking at the code to see how the file gets read.</p> <p>Please replace with/add a more suiting error message</p>

Hey,

thanks for your bug report. I think this has been solved meanwhile in the newest Fluid Trunk. At least in <https://svn.typo3.org/TYPO3v4/CoreProjects/MVC/typo3/trunk/Classes/View/TemplateView.php> the method parseTemplate now has a proper error message:

```
protected function parseTemplate($templatePathAndFilename) {
    $templateSource = file_get_contents($templatePathAndFilename);
    if ($templateSource === FALSE) {
        throw new Tx_Fluid_View_Exception_InvalidTemplateResourceException("'" . $templatePathAndFilename
        . "' is not a valid template resource URI.", 1257246929);
    }
    return $this->templateParser->parse($templateSource);
}
```

Do you agree on this?

Greetings,
Sebastian

I guess if the error message gets documented in some way (online or what not), there would be a list of possible reasons and then file permissions should be added to that list. But since documentation is relatively rare at the moment, this message is definately better than before.
