Description			
The params parenter for itemsProcFunc within flexform select fields used to get whole (parent) record information within \$params['row'].			
Now only the uid of the record and some flexform information is submitted. For new records this means it isn't possible to get a page id neither any other information.

[BUGFIX] FormEngine: Custom functions

The patch adds a .rst file to document that the "low end" functions within FormEngine (type=user, userFunc, itemsProcFunc) now receive different data and that this may change during the development of version 8 again.

Additionally the patch adds a change to hand over the "parent" row for flex field processing, so itemsProcFunc for flex fields can at least access the parent row data if needed.

Resolves: #70132

Resolves: #70467

Releases: master

We discussed that one at the Gladbach sprint and tried various scenarios.

We think that it is much to have row data and flex field data no longer mixed up, however it is still unfortunate for new records ... issue is still open and no final solution has been decided on, however, this issue will be decided on until final release.
