Description			
<p>It would be nice to have a hook in the pageview sysext so that additional vars could be added to the page preview target url. I can hook into the viewOnClick in the BackendUtility to add additional vars but not in the pageview extension itself.</p> <p>Something like: (in sysext/viewpage/Classes/Controller/ViewModuleController.php->getTargetUrl() @line:~154)</p> <pre>// Hook to append additional get vars. \$additionalGetVars = ''; if (isset(\$GLOBALS['TYPO3_CONF_VARS']['SC_OPTIONS']['viewpage/ViewModuleController.php']['getTargetUrl']) && is_array(\$GLOBALS['TYPO3_CONF_VARS']['SC_OPTIONS']['viewpage/ViewModuleController.php']['getTargetUrl'])) { foreach (\$GLOBALS['TYPO3_CONF_VARS']['SC_OPTIONS']['viewpage/ViewModuleController.php']['getTargetUrl'] as \$funcRef) { \$hookObj = \TYPO3\CMS\Core\Utility\GeneralUtility::getUserObj(\$funcRef); if (method_exists(\$hookObj, 'setAdditionalGetVars')) { \$hookObj->setAdditionalGetVars(\$additionalGetVars); } } } return \$protocolAndHost . '/index.php?id=' . \$finalPageIdToShow . \$this->getTypeParameterIfSet(\$finalPageIdToShow) . \$mountPointMpParameter . \$adminCommand . \$languageParameter . \$additionalGetVars;</pre>
