Description

I have a problem and I'm not sure whether it's a bug.

I have a table named "Berufe" and a second one named "Subbranche".
The tables are imported from another database.

My problem is the uid field.

The foreign_table_where config is working but TYPO3 try to get the UID in the subbranche table.

#TCA from Berufe

```
'subbranche_uid' => array(
    'exclude' => 0,
    'label' => 'Subbranche',
    'config' => array(
        'type' => 'select',
        'renderType' => 'selectSingle',
        'foreign_table' => 'tx_crm_domain_model_subbranche',
        'foreign_table_where' => 'AND tx_crm_domain_model_subbranche.subbranche_uid=###REC_FIELD_subbranche_uid### ',
        'minitems' => 0,
        'maxitems' => 1,
    ),
),
```

Is there a way to define another uid field for this foreign_table?

Or is there another solution?

- Status changed from New to Rejected

This is the tracker for bugs in the TYPO3 core, not a support channel for extension development.

What you describe is not a problem with the core but with your extensions TCA configuration.

Please head over to <https://forger.typo3.org/slack> register and ask for help in the #typo3-cms channel instead.
