

TYPO3 Core - Feature #78610

Allow record localization from non default language in the list module

2016-11-08 16:19 - Andrew Luca

Description

Would be great to have the possibility to localize records, from a non default language. However this is possible in **Page** module using **Localization Wizard**, but it is missing in **List** module.

note: have 3 languages. English(default), German, Dansk

For now in **List** module we have this

x5j9ohb.png

But would be great to have this

kj5oBtW.png

As I saw the buttons are just links, that have a format like this

```
typo3/index.php?route=/record/commit // route to Controller\SimpleDataHandlerController::mainAction
&token=f10a3d706e355ed40a13ba7dd4c53c882c027f1e // token
&prErr=1 // some error code
&uPT=1 // some other unique id
&vC=2471f0028b // some generated code
&cmd[tt_content][168][localize]=1 // DataHandler takes care to localize record 168 to language with uid 1
&redirect=/typo3/index.php?M=web_list // all this till the end of block takes care to redirect to new localized record
    &moduleToken=461c16a8e1be600907e758dffe6b9dee489ce80d
    &id=1
    &imagemode=1 // still don't know for what is this ))
    &jstLocalized=tt_content:168:1 // redirects to just localized to uid 1 of record 168
```

And I manipulated that URL a little bit to localize a record that was created in a non default language

When clicking manipulated link I have two behaviours.

TYPO3 v7.6.12

Record is "fake localized", I am redirected to list module, but localized record does not have anything in common with his parent record.

Parent was just used to take data from, and is just listed as another record with language uid that was requested.

wGpZo65.png

TYPO3 v7.6.11

The record was localized for real, I was redirected to it.

The readonly fields (TCA l10n_display) of each input that showed parent value was right.

The only issues I encountered was that

Transl.Orig select field showed records from default language, not from what I localized

I could save the record, but when I went back to list module, just localized record was not visible.

I looked in database and everything was fine, sys_language_uid, l18_parent, l18_diffsource (should be l10n, kept l18n for backward compatibility)

As a general idea. Transl.Orig is showed right, and localized record is not visible in list module (with v7.6.11)

History

#1 - 2016-11-08 16:35 - Andrew Luca

Have to mention that with v7.6.12 didn't look into database to see if related fields are right.

But as developers said, with this patch

<https://review.typo3.org/#/c/50022/>

Now record is localized in a right way, but is still not showed in list module, and **Transl.Origin** is still showing default language records.

#2 - 2016-11-08 16:46 - Tymoteusz Motylewski

- Subject changed from Allow record localization from non default language to Allow record localization from non default language in the list module

#3 - 2016-11-10 09:15 - Andrew Luca

Also in pages module you cannot localize, when you create a new content element in non default language.

Localizing from non default language to default language, also would be an option.

- File *cattura.png* added

Images are now missing, so it is difficult to say if this issue is still true; I guess it is so (10.4.0-dev); I followed these steps

- 1) Create a page in three different languages (Italian (Default), English (ID=1), French (ID=2))
- 2) Create a content element in italian and translate it in English (Translate mode)

Results

- 1) if you are in Page > languages mode and click on "Translate" button, it pops up the translation wizard and lets you decide if you want to take as starting point the original (italian) element or the english element
- 2) If you are on List view, the only "translate" button available in the one in the default language; no wizard pops out.

The screenshot shows the 'Page Content (1)' list view. The table has columns for 'Localization', 'Localize to', and 'Type'. The first row shows a 'Header' element with the text 'test'. It has a toolbar with icons for visibility, edit, delete, info, and refresh. To the right of the toolbar are icons for copy and delete. The 'Localization' column shows the Italian flag and the text 'Italian [Site: main]'. The 'Localize to' column shows a button with the French flag, which is highlighted by a red arrow. The 'Type' column shows 'Header'. The second row shows a translated version of the element with the text '[Translate to English:] test'. It has the same toolbar and localization options, but the 'Localization' column shows the English flag and the text 'English [Site: main]'. The 'Localize to' column shows a button with the Italian flag.
