Description

Hello,

today i moved my typo3 database from a server to my local maschine (Windows / XAMPP). With the remote database, everything works perfect.

When i change it to the localhost (exact the same database), i get the following error: #1325689164: Parent folder "/" does not exist. Then i output the exact files (`var_dump($parentFolder->getIdentifier()); var_dump($folderName);`) in Line 2271 in ResourceStorage.php File. The output says `string(1) "/" string(11) "_processed_"`.

After further inspections I recognized that in the database table "sys_file_reference" is the problem. If I set some of the entries as deleted, the page is build and working. The 2 rows which causing the Problem are with uid foreign 48 (tt_content) see the Screenshot.

Any ideas how to fix this?

I also tried in the Install Tools fix folder structure, database, cleared user sessions and so on.

The funny thing is, if i change it to the remote server, everything is working again (the remote database has the same entries).

History

#1 - 2016-12-09 20:41 - Harald Holzmann

Now i have created the folder /_processed_ then the page is build, but everything is empty.

Any ideas?

- *Tracker changed from Bug to Task*

- *Priority changed from Must have to -- undefined --*

Hello,

sorry - it was just a problem by the database transfer with the encoding. PHPMyAdmin had a problem with the encoding. It works now

Kind regards,
Harald

Hallo Harald,

could you specify the problem of your database and how you solve the problem, please?

Thank you
Martin
