

TYPO3 Core - Bug #82391

Inline records in TYPO3 v. 7.6.22 crash when NOT having sys_language_uid on children

Description

I have a few plugins containing records without DB field sys_language_uid..... - after upgrading to 7.6.22 I get an error 500 when trying to add the record as inline to.... let's say pages.

Sure I can add the language configuration fields, but maybe the core should check for the existence of the field before trying to set the field?!

sys/ext/backend/Classes/Controller/FormInlineAjaxController.php

```
if ($parent['localizationMode'] === 'select' && MathUtility::canBeInterpretedAsInteger($parent['uid'])) {
    $parentRecord = $inlineRelatedRecordResolver->getRecord($parent['table'], $parent['uid']);
    $parentLanguageField = $GLOBALS['TCA'][$parent['table']]['ctrl']['languageField'];
    $childLanguageField = $GLOBALS['TCA'][$child['table']]['ctrl']['languageField'];
    if ($parentRecord[$parentLanguageField] > 0) {
        $record[$childLanguageField] = $parentRecord[$parentLanguageField]; <-----!!!!!!!
    }
}
```

Greetings, Claus

TYPO3 rocks!!!!

The snippet posted seems to be from version 7.6.21; commit ID 9d3aa8618b changed this to

```
if ($parent['localizationMode'] !== 'keep' && MathUtility::canBeInterpretedAsInteger($parent['uid'])) {
    $parentRecord = BackendUtility::getRecord($parent['table'], $parent['uid']);
    $parentLanguageField = $GLOBALS['TCA'][$parent['table']]['ctrl']['languageField'];
    $childLanguageField = $GLOBALS['TCA'][$child['table']]['ctrl']['languageField'];
    $childData['databaseRow'][$childLanguageField][0] = $parentRecord[$parentLanguageField];
}
```

Either way, the behaviour is still "500" when trying to add childs to records that have

```
localizationMode === false
```

I think this is a regression, since 7.6.21 worked, as the check

```
if ($parentRecord[$parentLanguageField] > 0) {
```

caught this. I propose to add

```
$parent['localizationMode']
```

to the conditions - can anybody with some knowledge chime in?
