Description

Hi,

we had following pseudo code:

```
<typolink>
linktext
svg icon
</typolink>
```

The svg icon should only showed up, if the typolink is an external url. Finally i build a simple viewhelper and use typo3 core functionality:

```
public function render($link = '')
{
    /** @var LinkService $linkService */
    $linkService = GeneralUtility::makeInstance(LinkService::class);
    $linkDetails = $linkService->resolve($link);

    return $linkDetails['type'];
}
```

Maybe we could implementent these little viewhelper to the core?

Simple call

```
<f:link.linkhandler link="{link}" />
```

or inline

```
{f:link.linkhandler(link:'{link}')}
```

Thanks for creating this issue. However I don't see any sense in having this VH in the core. As you can have done it, this can be perfectly done with a custom VH or e.g. with JS or even with CSS: <https://davidwalsh.name/external-links-css> and hiding the svg via css.
