Description			
Given:			
A class that implemented the NewContentElementWizardHookInterface and wants to change wizardItems.			
Expected:			
As documented in the NewContentElementWizardHookInterface the hook object should get a parent object of class \Controller\ContentElement\NewContentElementController			
Actual:			
Due to change https://review.typo3.org/52999/ the hook gets a parentObject of type \TYPO3\CMS\Backend\Controller\Wizard\NewContentElementWizardController instead. As property visibilities changed, this change is unfortunately breaking.

[BUGFIX] NewContentElementWizardController to NewContentElementController

NewContentElementWizardController, which has been introduced for TYPO3 v9 to render the new content element process in a dedicated modal was just a duplicate of the existing NewContentElementController class with some minor adjustments and code flow enhancements (names, empty checks).

However, there have been several side effects like:

- hook implementing NewContentElementWizardHookInterface would have been called by both object instances, having different public properties ~~the most common access to \$parentObject->id or ~->sys_language~~ would have failed to to property visibility and change names
- the JavaScript closure callback to adjust the URL when interacting in the browser was hard-coded to modal rendering, with still having the possibility to render the old behavior e.g. in the web>list view

To overcome these flaws both mentioned classes have been merged since the functionality was not that much different anyway. Besides that different JavaScript client scopes ('window' or 'list_frame') are forwarded to the according object instances.

Resolves: #83705

Releases: master
