Description			
Bootstrap should not contain application specific code (HTTP vs CLI). The Application should handle their request handlers themselves.

[TASK] Directly wire Application and RequestHandler

The frontend and backend Application and RequestHandler classes are tightly coupled since the frontend eID request handler was moved into a middleware and the backend ajax request handler was merged with the regular request handler. (1:1 relationship)

There is no (longer) need to resolve the request handler in Bootstrap. For the install application we are still using two request handlers but will dispatch them from within the application now.

That means the call chain is now:

Application -> RequestHandler

instead of:

Application -> Bootstrap -> RequestHandler

That allows us to deprecate all HTTP related code in Bootstrap (with a separate commit) and instead implement that in an HTTP specific ApplicationTrait.

This patch introduces a legacy RequestHandler dispatcher middleware which ensures that registering custom request handlers using Bootstrap::registerAdditionalRequestHandler() still works for the frontend and backend.

(although it is marked @internal, there is interest to not just drop this)
