

TYPO3 Core - Feature #84805

Detect change-state of field earlier

2018-04-20 10:05 - Richard Haeser

Description With the new feature to only activate the save button when something changed, the change state should be checked earlier. Now if you are editing a field, but don't leave the field, the field is still in "not-changed" state and therefor, you don't have an activated save button.

suggested solution for detecting value changes <https://github.com/WebReflection/wrist>

this is needed because for custom editors the field value is set programmatically in a hidden field which does not trigger a change event.
