[TASK] Unify simulate user settings for Backend admins

The "Simulate user" functionality of the "User settings" module for backend admins is UX wise a distaster: This functionality is hidden behind the settings of the currently logged-in backend user in the toolbar, which then magically allows to change foreign user settings.

A much better approach to administrate user settings of other users is to fully switch to the target user using the "Backend User" module.

Additionally, if an admin user changes specific user settings of existing or new users over and over again (eg. backend language), sane defaults should be configured via User TSconfig "setup." instead.

The patch unifies this functionality by removing the additional simulate backend user selector from user settings module.

Resolves: #85196

[BUGFIX] Properly set user to admin in setup module

SetupModuleController serves as a backdoor so regular users without permission to manipulate be_users records can still edit their profile. For this to work, the access check needs to be bypassed for this particular record by DataHandler.

The start() method of DataHandler prepares e.g. exclude fields to be checked. With current code, incoming user is not yet set to admin, so exclude field checking may fail, especially if 3rd party extensions manipulate this. The patch hands a temporary user with activated admin flag to DataHandler, so it can bypass the access check for profile editing.
