Description

Current behaviour:
After updating the slug field in the page properties via the update button the new value isn't fully adopted.

Steps to reproduce:

1. Create a page
2. Rename the page
3. Update the slug field via the update button
4. Click the button to input a slug manually
5. Change the slug manually
6. Click the button for manually slug input again

Would expect:
After updating the slug the new value should be also in the field when clicking the "manual slug" and after the manually change the value should be this and not the value from updating.

[BUGFIX] Ensure manually updated slug is saved correctly

This fixes the bug, that after updating the slug and clicking
the toggle URL button, the slug isn't updated correctly.

Therefore, if the value of the input and read only field differ
after clicking the toggle button, now the updated value
of the input field is written into the read only and hidden field.

Furthermore after recreating the slug, the new value is now also
written into the input field to be present after clicking
the toogle URL button again. Otherwise the recreated slug would be
discarded on save.

While investigating in more detail, it gets clear that this isn't only a visual bug rather than a functional one.
Because not only the value of the readOnlyField isn't changed, the manually changed slug doesn't get written into the hidden input field at all.
Thats why the record still contains the old slug after saving.

Given a site with the current slug `/home`.
Following output is generated when running these console commands after different steps:

```
console.log('Input field: ' + $(".t3js-form-field-slug-input").val());
console.log('ReadOnly field: ' + $(".t3js-form-field-slug-readonly").val());
console.log('Hidden field: ' + $(".t3js-form-field-slug-hidden").val());
```

1. Open the record:

```
// Input field: /home
// ReadOnly field: /home
// Hidden field: /home
```

2. Click the toggle URL button:

```
// Input field: /home
// ReadOnly field: /home
// Hidden field: /home
```

3. Change the slug segment to `/home-test`:

```
// Input field: /home-test
// ReadOnly field: /home
// Hidden field: /home-test
```

4. Click the toggle URL button again:

```
// Input field: /home-test
// ReadOnly field: /home
// Hidden field: /home
```

If one save the record after step 3, the new slug will get written into database.
But if one click on the toggle button (step 4) again the hidden field which is responsible for the update is changed to the old value and the manually changed slug won't get written into database.

#9 - 2019-08-15 22:52 - Oliver Bartsch

Furthermore while testing the new Bugfix, I found another **misbehavior**.

If one updates the slug via the "slug-recreate" recreate button, the recreated slug is written into the hidden and the read only field But not into the input field. As a result, if one clicks the toggle URL button after recreating the slug, the input field with the old slug shows up instead of the recreated one.
