Description			
<p>The URI Builder fetches the slug field of the target page to generate the URI. This works also for pages with frontend group access restrictions, because PageRepository::getPage is called with disableGroupCheck.</p> <p>However when a translated page should be fetched, the disableGroupCheck argument is not pushed through the query which fetches the translation, which leads to the situation that the translation is not found and the slug of the default language page is used. In the end this leads to a wrongly composed URL.</p> <p>To reproduce:</p> <ol style="list-style-type: none">1. Create a page2. Translate the page to another language3. Add frontend group access restriction to page in default language4. Preview translated page (preview button of translated page)

[BUGFIX] Use correct slug for access restricted translated pages

Access restricted, translated pages currently always have the slug from the default language instead of their translated slug in the frontend. To generate correct urls, while using the "linkAccessRestrictedPages" option, the \$disableGroupAccessCheck parameter needs to also take into account for * PageRepository::getPageOverlay() when setting the option in PageRepository::getPage().

This "hack" is currently similar to what HMENU is doing, however this public property should not be used with the Context API instead.

This change however needs more refactoring on the Context API, which is why this solution is chosen for the time being (and also for v9 backport).

I cannot reproduce anymore in 9.5.15.
The preview link for the access restricted translated page is correct.

#10 - 2020-04-27 21:00 - Jonas Eberle

Oh, in a special case the bug still exists.

If the parent page is access restricted, too the preview link is wrong.
It is <language prefix of translated language>/<slug of default language>
