

TYPO3 Core - Feature #88300

Allow extra db columns in the records that are retrieved for the pagetree

Description

In `\TYPO3\CMS\Backend\Controller\Page\TreeController::getAllEntryPointPageTrees()` the `PageTreeRepository` is instantiated with the default db fields for each row (fields defined in `\TYPO3\CMS\Backend\Tree\Repository\PageTreeRepository::$fields`). Sometimes other db fields are also needed, but this can't be configured.

Use case: a custom icon for a page in the pagetree is desired, based on the value of a db field that is not one of the default fields. A `userFunc` can be defined to set the icon class, but here the db row only contains the default fields defined in the `PageTreeRepository` class. In earlier versions of TYPO3 the entire db row was passed to such a `userFunc`.
