

TYPO3 Core - Bug #88719

Close should recognize non-saved record - but fails

Description

After having assigned a target page to a shortcut page, the "Close" button should recognise that there was a change and therefore open a modal offering various editing option ("continue editing", "save and close" ...).

But in this case TYPO3 just closes the page without saving.

This is incoherent behaviour and should be matched to the procedure known from editing content elements.

Example to reproduce:

1. Create a new Shortcut page
2. Create a new nested Standard page
3. Go to the Shortcut and choose "edit page"
4. Assign the new Standard page as target
- 5 Click "Close"

Expected behaviour:

A modal opens with options how to continue editing

What really happens:

TYPO3 just closes the page with saving and without opening a modal.

- Status changed from New to Needs Feedback

I think that this one has been solved on version 9 and 10

My tests:

Test 1

- 1) Create a new shortcut page
- 2) Assign as target an existing standard page
- 3) Click **Close** instead of **Save**

Result: the modal window that asks whether the page should be saved appears.

Test 2

- 1) Save the previous shortcut
- 2) Open the previous shortcut page
- 3) Select another existing standard page
- 4) Click **Close** instead of **Save**

Result: the modal window that asks whether the page should be saved appears.

Is this sufficient? Am I forgetting something?

#4 - 2019-11-10 13:32 - Robert Wildling

Just tested in again on a 9.5.10 instance and can confirm that the behaviour is working as expected now.
Thank you!
