Description

pid=85

Show these types of broken links

Show this level: This page (should only show links on this page (pid=85))

Broken links total	
Internal Links	0
File Links	0
External Links	1

Listing of broken links

Element	Path	Link	URL / Link Target	Error m
test for #61709 : [BUGFIX] Show Broken Links of Pages on the Page itself (Field: Canonical link)	/Congratulations/Test broken links xyz ssdf/	path for page 85	https://wrong-canonical-link-on93	Network domain

This is a broken link for page 93, when clicking on this, we edit 93

Reproduce

```
- parent page (Show report)
|
---> subpage (with broken link in pages.canonical_link)
```

1. set wrong link with pages.canonical_link (seo)
2. make sure searchFields include canonical_link in TSconfig
3. Crawl for broken links
4. Set Report: "Show this level: This page" on parent page

The broken link on the subpage will be displayed

Cause

Assumption: probably wrong interpretation of **record_uid** and **record_pid** (in tx_linkvalidator_link) for pages:

- usually (e.g. for tt_content elements) record_uid is uid of element where broken link is found and record_pid is page id
- for pages: record_uid is uid of page and record_pid is uid of parent page.

But in the GUI record_pid is always interpreted to mean page id.
