<b>Description</b>			
Hallo Core Team,			
in ExtensionManagerUtility at addPlugin you wrote:			
<pre>@param array \$itemArray Numerical array: [0] =&gt; Plugin label, [1] =&gt; Underscored extension key, [2] =&gt; Path to plugin icon...</pre>			
Of course array key 1 could be the extension key, but one extension can provide multiple plugins and in that case you need something to differ.			
It's the value which will be stored in column CType (or list_type). It's more a plugin name or a content element identifier. Further you have the extensionName as third parameter already. So it does not make sense to define ExtKey twice.			
Stefan

##### Revision 6d374b66 - 2020-01-16 08:53 - Benni Mack

[BUGFIX] Clarify description in ExtensionManagementUtility::addPlugin

The description that the extension key should be used - instead of the plugin identifier is wrong, and is now adapted.

Resolves: #90113

Releases: master, 9.5
