Description

Hi,

I wanted to create a custom Fluid Template for the felogin in my project and I was wondering that it didn't work. That's how I started testing:

1. I deactivated the Fluid Template to try the old version and adjusted the constant "styles.content.loginform.templateFile" to a old file.

Result: I get the following error:

```
ERROR: Content Element with uid "27" and type "felogin_login" has no rendering definition!
```

2. I have activated the Fluid Template again and adjusted the constant "styles.content.loginform.templateFile" to a Fluid Template again. I added a line in to the template of /sysext/felogin/ to verify if my set file works.

Result:

```
styles.content.loginform.templateFile =  
- EXT:myextension/path/Login.html  
- FILE:EXT:myextension/path/Login.html  
- fileadmin/Login.html  
- /fileadmin/Login.html  
- FILE:fileadmin/Login.html
```

All variants do not work. only the file from "sysext/felogin/" is loaded.

It seems that the templating is currently not working or is not yet properly documented.
