Description A widget is missing that fetches live data from an API endpoint via XHR requests and then displays this data in a graph, for example. Examples are: <ul style="list-style-type: none">- CPU load- Opened content elements (edit)- Current / total logged in frontend or backend user- OpCache usage- ... The dashboard has little effect if the data is static and the browser / dashboard module needs to be reloaded. Admins or chief editors want to see live data.

I think the solution as created for [#93210](#), will solve this issue isn't it?

- Status changed from Needs Feedback to Closed

It is now possible to refresh the widget both with a button (when enabled in widget configuration) or by a JavaScript event. See <https://docs.typo3.org/c/typo3/cms-dashboard/master/en-us/Developer/MakeRefreshable.html> for more information. I will close this issue now. If you think, still some things are missing, just let me know!
