#### Description

The "previous step" button in multi-step forms within the frontend does not work.

Example form definition:

```
identifier: test
type: Form
prototypeName: standard
renderables:
  -
    identifier: page-1
    type: Page
  -
    identifier: summarypage
    type: SummaryPage
```

A click on the "previous step" button does not redirect to the previous step. Instead, the form still stay on the current step.

[BUGFIX] Make ext:form previous step button work again

Since #92815 the extbase request dispatcher sets an "original request" within a subrequest in case of a "ForwardResponse".

The fluid AbstractFormFieldViewHelper::hasMappingErrorOccurred() guesses that a property mapping error exists as soon as a request is a subrequest. This is determined by the fact that the current request has a original request (e.g. if a controller returns a ForwardResponse).

While the determination of "property mapping error exists" based on the existence of a parent request may not be the best indicator, it seems to be fine for EXT:form for now.

EXT:form makes further use of the HiddenViewHelper to set the previous page index as a value for the property "\_\_currentPage". Since this ViewHelper always sets the respectSubmittedDataValue property to TRUE, the value is always overwritten in case a parent request exists and the "previous step" button did not longer work.

This is now fixed by making the respectSubmittedDataValue property configurable via a ViewHelper argument and setting in to FALSE for the "\_\_currentPage" field.

Resolves: #93398

Releases: master
